

LINUX COMMANDS

1.	pwd	pwd	Shows the current directory
2.	ls	ls	Lists files and folders
3.	cd	cd Documents	Changes the current directory
4.	mkdir	mkdir project	Creates a new directory
5.	rmdir	rmdir old	Removes an empty directory
6.	touch	touch index.html	Creates a new empty file
7.	cp	cp a.txt b.txt	Copies a file or directory
8.	mv	mv old.txt new.txt	Moves or renames a file
9.	rm	rm test.txt	Deletes a file
10.	echo	echo "Hello"	Prints text to the terminal

GIT COMMANDS

1.	git init	git init	Creates a new Git repository
2.	git status	git status	Shows the current state of files
3.	git add	git add index.html	Moves changes to the staging area
4.	git commit	git commit -m "Initial commit"	Saves staged changes as a commit
5.	git log	git log	Displays commit history
6.	git diff	git diff	Shows changes between versions
7.	git restore	git restore file.txt	Restores a file to its previous state
8.	git branch	git branch feature	Creates or manages branches
9.	git checkout	git checkout main	Switches branches or restores files
10.	git clone	git clone URL	Copies a remote repository locally
11.	git push	git push origin main	Uploads commits to a remote repository
12.	git pull	git pull origin main	Downloads and integrates remote changes
13.	git fetch	git fetch origin	Downloads remote changes without merging
14.	git remote	git remote -v	Shows remote repository connections

Three Tree Architecture of Git

Git uses three main areas to manage changes:

1. Working Directory – The files you are currently editing or working on.
2. Staging Area (Index) – Holds the changes you selected to include in your next commit using `git add`.
3. Repository (Git Directory) – Stores your committed changes and project history.

Edit file → `git add file.txt` → `git commit -m "Update file"` → Saved in Repository
